

BETSEBAY GETAHUN

Full-Stack & Mobile Developer

getahunbetsebay63@gmail.com • +251 90 825 6262 • Addis Ababa, Ethiopia • github.com/betsebaygetahun

I'm a 5th-year Computer Engineering student, and honestly, most of what I actually know I learned by breaking things in real projects — not by finishing tutorials. I've shipped a Flutter app that handles real money moving through it, helped lead the frontend on a national organization's website, and I'm part of the small team still actively pushing updates to teftef.io right now. I like owning a problem end to end, and when I've worked with others, I've genuinely enjoyed the part where I get to explain something I just figured out to someone still learning it.

PROJECTS

Restaurant Order Management System *Independent — Live*

I built this alone, in Flutter, because I wanted to go past 'it works on my machine' and actually ship something. It handles menu management, orders, and day-to-day operations, and it's live right now on Firebase.

- The payment gateway integration was genuinely the hardest thing I've built — not the happy path, but all the ugly parts: failed payments, pending states, what happens when a user closes the app mid-transaction. That's where I actually learned what 'production-ready' means.
- No one assigned me any of this. Architecture, UI, backend structure, deployment — all mine, mistakes included.
- Tech stack: Flutter, Firebase, payment gateway API.

Ethiopian Youth Council Platform *Team project — Live*

This one I built as part of a small team, and I ended up leading a chunk of the frontend work — a multi-page platform for a national youth organization covering membership, programs, and news.

- I spent a fair amount of time helping teammates who were newer to this figure out how to structure components and hook the frontend up to real content, the same way someone once had to explain it to me.
- Built out responsive layouts that had to handle pretty different content types — program pages don't look like news pages, and both had to feel like the same site.
- Tech stack: TypeScript, responsive CSS, deployed on Vercel.

Teftef.io *Team project — Live, actively maintained*

Still working on this one with my team — it's not a 'build it and walk away' project. We keep shipping improvements to both the frontend and the backend API layer.

- Tech stack: full-stack web, REST API integration.

Event Management System (Dinkenesh-EMS) *Team project — GitHub*

Built with classmates. This was the project that taught me how much messier real data handling gets the moment more than one person — and real users — are involved. Clean data on paper and clean data in practice are two very different things.

- Worked with the team on how we structured event data so records stayed consistent instead of drifting out of sync.
- Tech stack: JavaScript.

Auth Demo *Independent — GitHub*

I built this one specifically because I was tired of just importing an auth library and trusting it blindly. Wanted to actually understand sessions and authentication from the ground up, not just get the green checkmark.

- Tech stack: TypeScript.

EDUCATION

Bachelor's Degree in Computer Engineering

Addis Ababa University • 5th Year, in progress • Addis Ababa, Ethiopia

SKILLS

JavaScript, TypeScript, HTML, CSS, Java, Python (basics), Flutter, REST APIs, Firebase, Payment Gateway Integration, Git, GitHub, Spring Boot (learning), Responsive Design, Cross-browser Testing

LANGUAGES

Amharic — Native • English — Strong professional proficiency (written & verbal)
